## RESEARCH SUMMARY

---

My general research interests are in the areas of artificial intelligence (AI) and machine learning (ML) where I focus on advancing foundations of AI/ML to solve challenging real-world problems with high societal impact. The overarching theme of my research program is *AI to Accelerate Scientific Discovery and Engineering Design*. A large focus of my current work is on developing novel adaptive experimental design algorithms to optimize combinatorial spaces (e.g., sequences, trees, graphs, and mixture of discrete/continuous design variables) and applying them to solve high-impact engineering and science applications (e.g., drug/vaccine design, nanoporous materials design, biological sequence design, hardware design, and additive manufacturing). Specific topics include:

- Probabilistic modeling (Gaussian processes, deep models, and their combination) over structured data
- Methods to combine domain knowledge and experimental/observational data to create rich structured models
- Principled data acquisition strategies for diverse goals (e.g., optimization, discovery, and predictive models)
- Creating predictive models and sequential decision-making policies using small training data
- Accelerate the discovery of nanoporous materials for sustainability applications (e.g., storage and separation of gases); accelerate the design of effective, safe, and low-cost drugs and vaccines; biological sequence design (e.g., proteins) for health applications; design of high-performance and low-power hardware to overcome Moore's law; and improving additive manufacturing processes for their effectiveness.
